

### Proposal

We're making a website on what outfit to wear based on the weather of the day. Our project is useful because if you are struggling on finding an outfit to wear, this website will help you wear something that is fit for the weather. We will be using HTML, CSS and Javascript. There's going to be a bootstrap carousel, a weather widget and a description on the outfit. The carousel is going to be the most complicated part because it's hard to make it work properly. We're going to have a nice background, an animated weather icon and multiple outfit recommendations for each weather in the carousel.

List of 20 milestones:

1. Make outline of website
2. Make a creative title
3. Setup the website (half girls and boys)
4. Apply background and the layout
5. Make weather widget
6. Download bootstrap and start carousel
7. Figure out weather icon animation
8. Brainstorm outfits for women
9. Start looking for outfits online
10. Finalize carousel and input outfits into carousel
11. Brainstorm outfits for men
12. Start looking for outfits online
13. Finalize carousel and input outfits into carousel
14. Write descriptions for the outfits chosen
15. If no space for men, make a second page or make a parallax scrolling page
16. Fix all errors
17. Start thinking of how to improve website
18. Any additional add-ons should be getting started on
19. Fix other errors from the improved version of the website
20. Make sure everything is aligned and set up properly before submitting the final outcome.

We're going to do one milestone each week except for the small and easy milestones. We actually aren't going to split up our workload as partners because we are going to go to each other's houses to work on the project together as one.
